

## 2020 Bayleaf Water Main Flushing Plan

Updated as of: 3/16/2020

Water main flushing is done to remove sediments from water distribution systems. During this activity, water is forced through underground water mains at high speed and flushed out of hydrants and blowoffs. Flushing can take a few minutes to several hours. Since flushing can use a high volume of water, it is typically scheduled during low water usage periods (winter and early spring) to take advantage of decreased customer usage within the system during these times. To address immediate discoloration issues, flushing is done at that time.

The dates below are the periods when system flushing may impact a group of subdivisions within the Bayleaf Master Water System. The system is interconnected and flushing in one subdivision may impact other subdivisions in the group. These groups of subdivisions are shown below:
